AVANTech Awarded Contract for Groundwater Treatment System from Fluor Hanford

AVANTech was recently awarded a contract from Fluor Hanford to design, build, and test a groundwater treatment system specifically designed to remove hexavalent chromium. Chromium is reduced to the trivalent form prior to being packaged as a non-hazardous solids cake. The proposed treatment system is designed to treat the projected influent water and reduce the hexavalent chromium from a maximum of 2,000 parts per billion (ppb) to less than 10 ppb. The design includes electrocoagulation, clarification, filtration, and a filter press to handle the solids. Our broad range of skills enables us to quickly integrate complex projects.

Avantech is a water-treatment company with a commitment to providing service second to none! Avantech was founded in 1999 and has expanded its business by applying the talents of its technical team. AVANTech's approach to services integration makes us uniquely qualified to provide turnkey services. Our personnel have extensive experience in the planning, design, manufacturing and operation of water-treatment systems for industrial and government clients. AVANTech technologies have enabled many industrial facilities to establish zero liquid discharge operations by completely recycling all of their wastewater. "This contract is an excellent example of our ability to solve clients' complex problems in a simple and cost-effective manner. "AVANTech is committed to customer service excellence by implementing creative engineered solutions that create unique value for our water/wastewater customers," stated AVANTech President Jim Braun.
